

## SAFETY BUMPER

Safety Bumper are components that allow the slowing or stopping of moving machinery due to accidental impact with a person or an object

Thanks to their construction, they allow a first deformation without this causing the blocking of the machinery in case of accidental and light contacts with people or things

On other hand, if impact is significant, the bumper causes the block of the machine allowing, due to its construction, a further extra-stroke of the soft part to avoid significant damage

Today bumpers are not only a safety component but also a design element that complete the machine

Gamma System, thanks to over 20 years of presence and experience in the safety field, is able to offer a complete series of bumper solution in accordance to customer's design in different types of coating and colour to respond quickly and efficiently to any construction requirements
